

Krithik US

MERN Stack Developer

✉ krithikus2004@gmail.com ☎ 91+ 8618570153 📍 Bengaluru 🔗 LinkedIn 🐙 GitHub 🌐 Portfolio

Profile Summary

MERN stack developer with two deployed full-stack applications — a role-based blogging platform with JWT, Firebase, and Google OAuth authentication, and a URL safety scanner that runs VirusTotal's 90-engine threat analysis alongside a live headless browser crawler simultaneously. Both are live on Render with MongoDB Atlas — not local builds. Looking for a web developer role where API design, backend logic, and frontend integration are the daily work.

Technical Skills

- **Frontend:** React.js, Redux Toolkit, JavaScript (ES6+), TypeScript, Tailwind CSS, HTML5, Vite
- **Backend:** Node.js, Express.js, FastAPI (Python)
- **Database:** MongoDB (Mongoose)
- **Auth:** Firebase Auth, JWT, Google OAuth
- **Tools:** Git, GitHub, Postman, Cloudinary
- **Deployment:** Render, MongoDB Atlas
- **Other:** Python, Flask, scikit-learn

Internship Experience

Hope Foundation | Web Development Intern | Jan 2025 – Mar 2025 | Bengaluru

- Built a Flask REST API with two production routes — a crop prediction endpoint backed by a Random Forest classifier (98.2% test accuracy across 22 crop types) and a market price query endpoint that filters a government agricultural dataset and returns structured JSON to the frontend.
- Integrated OpenWeatherMap as a separate weather microservice deployed independently on Render, consumed by the main React app via Axios for location-based 7-day forecasts.
- Developed the React + TypeScript frontend with Chart.js, building mobile-responsive grouped bar charts for historical mandi price trends with per-commodity summary stats (average, peak, and floor prices).
- Deployed the complete application across two Render services — Flask backend and React static site — with environment-specific configs and CORS handling between them.
- Led the team across the project: assigned module ownership, coordinated frontend-backend integration, resolved blocking issues during development, and presented the finished platform to Hope Foundation's evaluation panel.

Projects

- **Admin-Managed Blogging Platform - Project URL:** <https://a2d-blog.onrender.com/>
- **Tech Stack:** React.js, Redux Toolkit, Node.js, Express.js, MongoDB, Firebase Auth, JWT, Tailwind CSS
- Built three independent auth flows in one system — Firebase Google OAuth, custom JWT login, and cookie-based sessions — all running through the same middleware with role-based route protection.
- Designed REST APIs covering post management, user control, comment handling, pagination, and search, each route protected by admin or user role middleware.
- Only admins can write and publish posts — regular users interact through comments and likes, keeping content controlled without locking out the audience entirely.
- The admin dashboard shows a live count of users, posts, and comments with full delete and moderation controls from a single view.
- **Bullseye — URL Safety Scanner - Project URL:** <https://bullseye-n9jz.onrender.com/>
- **Tech Stack:** React.js, Vite, FastAPI (Python), MongoDB, VirusTotal API, Cloudinary, Tailwind CSS
- Built a dual-pipeline backend that runs VirusTotal's 90-engine threat scan and a custom headless Chromium crawler simultaneously — both results land in a single frontend response, not sequentially.
- Full scan workflow: URL input → parallel API + crawler execution → screenshot uploaded to Cloudinary → results saved in MongoDB with Safe or Malicious status tagging.
- Paste any URL and get two independent checks at once — a threat database verdict and a live screenshot of the actual page, so you see both what the data says and what the site looks like before clicking.
- Every scan is stored and filterable by status, so users can review past results without re-running the scan.

Education

- Bachelor of Computer Application — East Point Group of Institutions | 2022–2025 | CGPA: 8.87/10
